Trellis | Feature Requirements

Product Owner review summary • 22 October 2026 • Revised draft v1.1

This summary records the features requested for the initial user of Trellis. It is intended for Product Owner review, not as a technical specification or implementation commitment. Commercialization is outside the current scope.

1. Dashboard, audit & opportunities

The home screen should be a Dashboard tailored to the user's Instagram account and activity.

- Audit the user's bio, published posts and account performance; identify actionable opportunities to improve the bio, posts and overall content approach.
- Refresh the audit and opportunities daily, with an option to refresh manually.
- Show analytics such as post performance, follower demographics and changes across different periods.
- Help investigate possible reasons for unfollows using observable activity, without presenting speculation as fact.
- Include the Content Planner within the Dashboard.

2. AI Chat & content creation

AI Chat should both analyze account data and help prepare usable Instagram content, with recommendations suited to the individual user.

- Answer natural-language questions and provide comparisons, explanations and practical recommendations grounded in available evidence.
- From uploaded images, produce a complete post package: hook, caption, call to action (CTA) and hashtags; accurately match the content to the correct images and products.
- Learn the creator's content style from existing posts and captions. Writing should be concise, conversational, natural and human—not robotic or monotonous.
- Reflect the user's own skincare experiences and product opinions when available; ask for relevant preferences when preparing content.
- Help choose the most suitable format for a proposed post (for example, Reel or carousel) from the available options.

3. Content Planner & publishing

The planner belongs within the Dashboard. It should support organizing content and completing planning work in bulk—not just placing items on a calendar.

- Confirmed workflow: create an idea or upload images → generate and edit content → save draft → review and approve → schedule and publish.
- Support day-to-day planning preferences: the user can decide the intended content style or type for each day, with guidance on which post format best suits the content.
- Manage drafts, planned posts, tasks and bulk planning activities.
- Support content review and approval as well as scheduled automated Instagram publishing.
- Offer a better planning experience than Growy's calendar.

4. Competitor analysis

Help the creator compare their own account with competitors that genuinely belong to the skincare niche.

- A competitor qualifies for skincare-focused comparison only if all five of its most recent posts are skincare-related, to reduce false positives.
- Compare the user's content and performance directly with eligible competitors when comparable public data is available.

- Highlight differences, possible explanations for stronger competitor performance, and specific opportunities for the user to improve.

5. Hot Topics, ideas & platform updates

Combine Hot Topics, niche ideas and swipe-style discovery in one experience.

- Explore both trending ideas already used by creators and relevant ideas that are not currently trending.
- Browse, save, swipe to accept or reject ideas, and discuss them in AI Chat.
- Provide officially announced Instagram algorithm changes and updates to Instagram's Edits app; distinguish official information from interpretation.
- Use applicable updates and trends to inform content-format suggestions, hooks, captions and CTAs.

6. Posts & content consistency

- Make published posts, drafts and planned content accessible in one coherent experience.
- Support comparison of the user's own content and its elements, including imagery, captions and formats, where useful.
- Understand the creator's skincare focus and content style from existing material; no separate "My Brand" feature is requested.

7. User experience & navigation

- Retain the agreed three-section navigation structure, with related capabilities grouped within it.
- Dashboard is the home screen and contains the Content Planner; AI Chat and Hot Topics should remain prominent.
- Ensure usability on desktop, mobile browsers and iPad browsers.
- Adapt recommendations and content output to the specific user's account, experiences, preferences and performance—not generic assumptions.

Remaining details for review

Confirm the exact handling of bulk planner tasks, publishing approvals and failures; the day-to-day planner controls and content-format options; which performance and content comparisons matter most; and how opportunities should be presented. The requirements above describe desired behavior, not confirmed technical feasibility.

Product Owner review: ☐ Accurate as written ☐ Changes requested
